^a This table reports effects of program eligibility and local mean treatment effects of program participation. All regressions included stratification variables, baseline medical diagnoses, and baseline medical utilization as controls. All regressions were weighted by the employee's number of months of insurance coverage in the post-intervention period. The 2017 period is defined as August 2016 to July 2017, and the 2018 period is defined as August 2016 to July 2018. The sample size of the regressions ranged from 3,164 to 3,167.

^b Adjusted P values account for the number of hypotheses tested in each domain. We tested 6 hypotheses in the medical diagnoses domain and 6 hypotheses in the medical utilization domain.

^c The standardized treatment effect gives equal weight to each outcome within a domain and includes both the 2017 and 2018 outcomes.
